# DIY Home Internet Security Policy

Step One
Start with password compliance.
Require everyone in your household to use unique passphrases instead of passwords for every account, change them often, and implement two-factor authentication wherever possible!

Step Two
Change factory defaults of all devices.
Routers, TVs, baby monitors, anything that connects needs to be updated right out of the box! Factory default passwords and logins are security risks.

Step Three
Share with care.
What gets posted stays posted. In other words, don't put anything on social media that could hurt you in the future or leak sensitive information.

Step Four
Admin accounts are for administrators.
Only one person needs to use the admin account. See to it that no one else has those privileges.

Step Five
Stop. Think. Connect.
Verify the validity of websites before entering credentials, don't respond to requests for personal info, and think before you click!

Step Six
Guest accounts are for guests.
Even if it's your BFF, never give out your personal usernames and passwords to anyone. That's why we have a guest wireless network and guest accounts for devices.

Step Seven
If you hear something or see something, say something!
Report any and all scams, inappropriate behavior, or cyberbullying.
